Library ECOM_Devices

Library ECOM_Devices was designed in TIA Portal V17 and it includes basic parts for support of ECOM devices using TCP or serial communication. Functions and functions block are created from blocks available for both PLC models S7-1200 and S7-1500. Library is opened so it is possible to edit blocks according to needs. The most of functions and function blocks are written in SCL language.

Important parts:

- Communication blocks TCPCom and SerialCom with its data type definitions.
- Detector TOY18DAD main blocks TOY18_Prot and TOY18_Control with its data type definitions (TOY18_SCAN, TOY18_WPARS, TOY18_RPARS) and support functions (LinkedFC).
- Pump ECP2000 main blocks ECP_Prot and ECP_Control with its data type definitions (ECP_WPARS, ECP_RPARS) and support functions.
- Additional useful functions (General).
- General data types TCP_PARS, SER_PARS, COM_CTRL and PROT_CTRL.
- Constant tag tables COM_Prot_table, BIGPROT_Prot_Table, TOY18_Prot_Table and ECP_Prot_Table with definitions of constants for parameters, commands, states and errors.
- Example data blocks T18_DB and ECP_DB.
- Additional useful blocks Debug and SystemTicks for testing purpose.

Project example 1 (S71200_toy18_test_tcp1.ap17)

Example project 1 demonstrates using of above library. Create new project and configure PLC. Add function blocks “TCPCom”, “TOY18_Prot” and “TOY18_Control”, tag tables “COM_Prot_Table”, “TOY18_Prot_Table” and data block “T18_DB” into project from ECOM_DEVICES library. Insert main function block into networks and define its parameters to match T18_DB. See pictures below.

Project tree

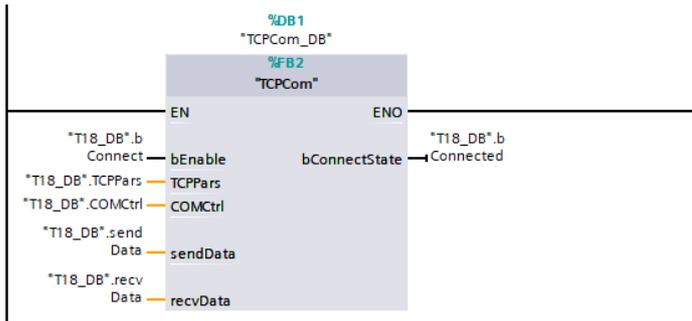

The screenshot displays the Siemens SIMATIC Manager interface for a project named "S71200_toy18_test_tcp1". The interface is divided into several panes:

- Project tree (left):** Shows the project structure, including "PLC_1 [CPU 1212C DC/DI/DO]", "Program blocks", and "Main [OB1]". It lists various data blocks like "T18_DB", "TCPCom_DB", and "TOY18_Control_DB".
- Block interface (center):** Displays two network diagrams:
 - Network 1:** Titled "TCP connection block (TCP through PROFINET)". It shows a function block "TCPCom" with inputs "EN" and "bEnable" (connected to "T18_DB.b.Connect") and outputs "ENO" and "bConnectState" (connected to "T18_DB.b.Connected").
 - Network 2:** Titled "Detector protocol block". It shows a function block "TOY18_Prot" with inputs "EN" and "COMCtrl" (connected to "T18_DB.COMCtrl") and outputs "ENO". It also shows data exchange between "T18_DB" and the block.
- Libraries (right):** Shows the "Global libraries" pane with a list of components from the "ECOM_DEVICES" library, including "Communication", "ECP2000", and "TOY18BAD".

Main [OB1]

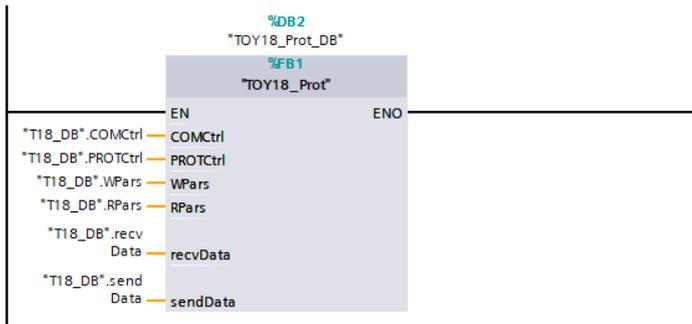

Network 1: TCP connection block (TCP through PROFINET)

Comment

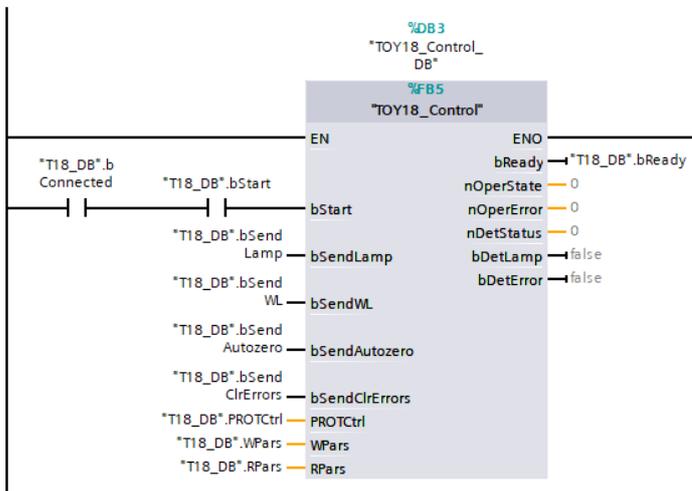

Network 2: Detector protocol block

Comment

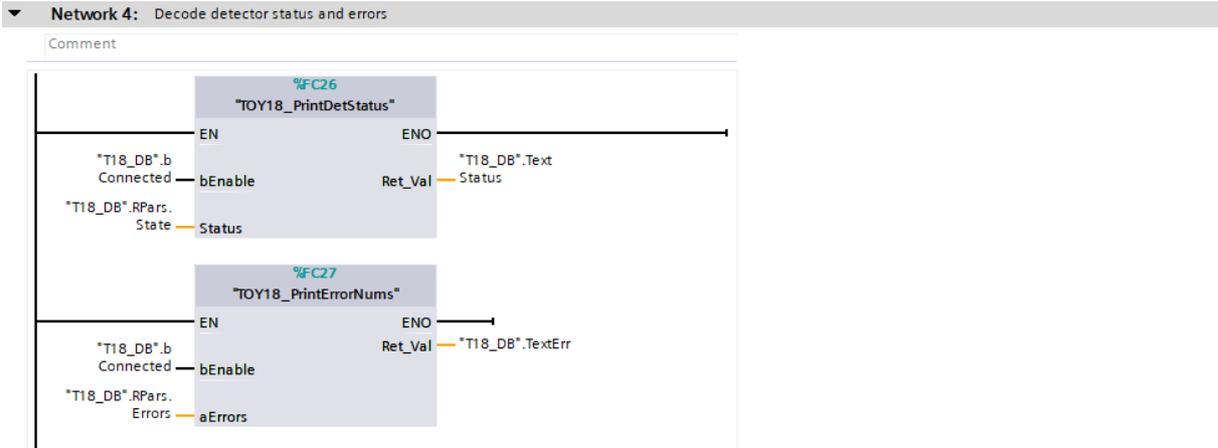

Network 3: Detector control block

Comment

Network 4 demonstrates additional functions for decoding detector status and errors to strings.

T18_DB [DB101]

Example of interconnection data block T18_DB. Set default parameters to set adequate demands.

TOY18_Prot_Table

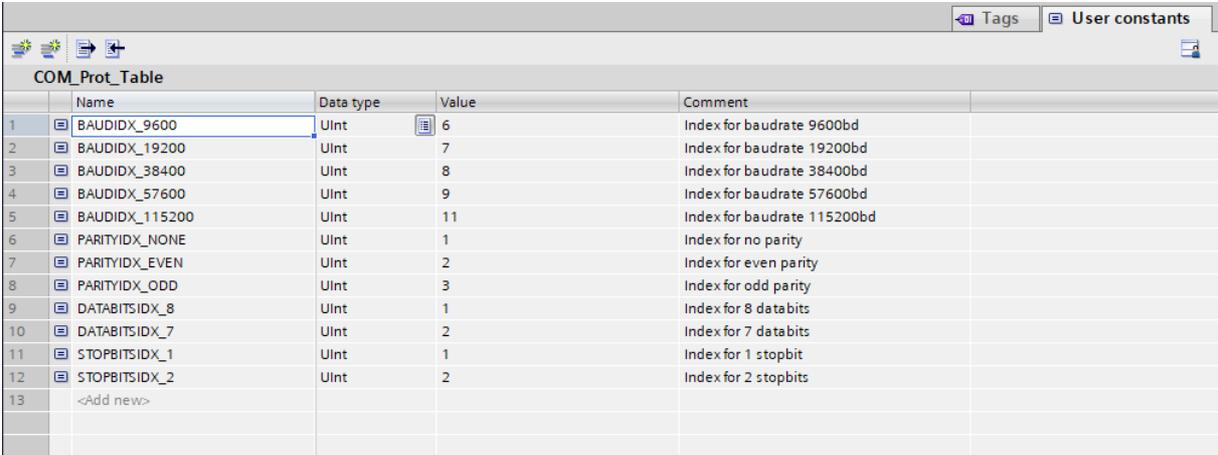

Tag table includes global user constants, which are used inside function blocks and support functions (e.g. TOY18_CreateCommandStr, TOY18_DecodeResponse). It needs to be part of a project!

	Name	Data type	Value	Comment
1	DETTYE_UNKNOWN	USInt	0

See List of TOY18 constants (TOY18_Prot_Table) on page 32 for details.

COM_Prot_Table

Tag table includes global constants for serial communication (baudrates, databits, parity, stopbits). It needs to be part of a project when SER_PARS variable is included (T18_DB)!

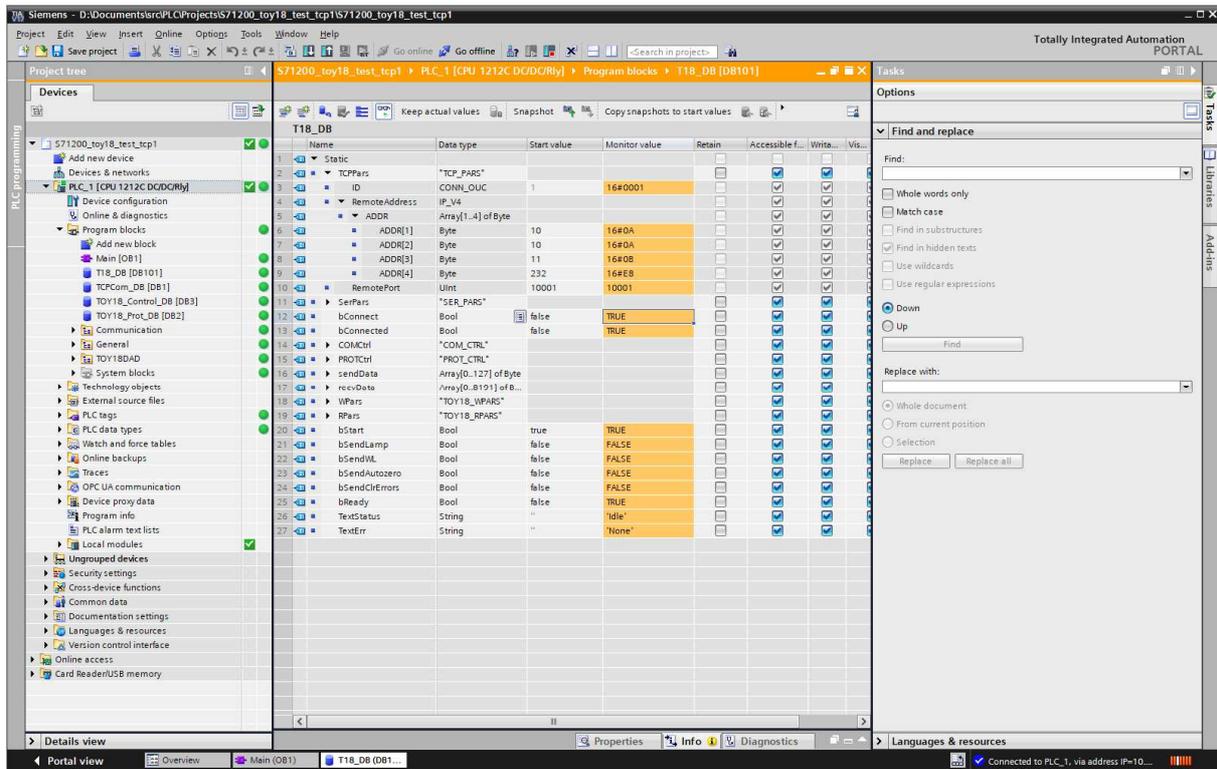

The screenshot shows a software interface with a table titled "COM_Prot_Table". The table has columns for Name, Data type, Value, and Comment. The rows list various constants for serial communication, such as baudrate indices (BAUDIDX_9600 to BAUDIDX_115200), parity indices (PARITYIDX_NONE, PARITYIDX_EVEN, PARITYIDX_ODD), and databits/stopbits indices (DATABITSIDX_8, DATABITSIDX_7, STOPBITSIDX_1, STOPBITSIDX_2). The first row, BAUDIDX_9600, is highlighted.

	Name	Data type	Value	Comment
1	BAUDIDX_9600	UInt	6	Index for baudrate 9600bd
2	BAUDIDX_19200	UInt	7	Index for baudrate 19200bd
3	BAUDIDX_38400	UInt	8	Index for baudrate 38400bd
4	BAUDIDX_57600	UInt	9	Index for baudrate 57600bd
5	BAUDIDX_115200	UInt	11	Index for baudrate 115200bd
6	PARITYIDX_NONE	UInt	1	Index for no parity
7	PARITYIDX_EVEN	UInt	2	Index for even parity
8	PARITYIDX_ODD	UInt	3	Index for odd parity
9	DATABITSIDX_8	UInt	1	Index for 8 databits
10	DATABITSIDX_7	UInt	2	Index for 7 databits
11	STOPBITSIDX_1	UInt	1	Index for 1 stopbit
12	STOPBITSIDX_2	UInt	2	Index for 2 stopbits
13	<Add new>			

See List of COM constants (COM_Prot_Table) on page 35 for details.

Project functionality

Project can be tested when it was compiled and downloaded to PLC successfully. Parameter T18_DB.TCPPars.RemoteAddress needs to be set correctly to connect real detector. Connection is started by toggling parameter T18_DB.bConnect from FALSE to TRUE. Successful connection is signaled by TRUE parameter T18_DB.bConnected. Picture below shows situation when data block T18_DB is watched.

Because parameter T18_DB.bStart was already TRUE, communication with detector controlled by TOY18_Control was started. Status subscription should be running. Actual detector status is “Idle”. The output T18_DB.bReady should be TRUE.

Lamp can be started by setting parameter T18_DB.WPars.Lamp to TRUE and changing parameter T18_DB.bSendLamp from FALSE to TRUE. Measurement state would be reached after lamp is on and status and absorbance subscriptions should be running.

20	bStart	Bool	true	TRUE
21	bSendLamp	Bool	false	TRUE
22	bSendWL	Bool	false	FALSE
23	bSendAutozero	Bool	false	FALSE
24	bSendClrErrors	Bool	false	FALSE
25	bReady	Bool	false	TRUE
26	TextStatus	String	"	'Measure'
27	TextErr	String	"	'None'

Absorbance is read using asynchronous reception of absorbance subscription into variable T18_RPars.Absorbance. Control software can read absorbance from this variable in the same or

lower rate than absorbance is measured (CMD_WRITE_RATE). But absorbance data can be buffered in communication and block TOT18_Prot can process more samples in one clock. If recording of exact samples needs to be guaranteed, it is recommended to record absorbance sample directly in function TOY18_DecodeResponse (CMD_SUBS_ABS).

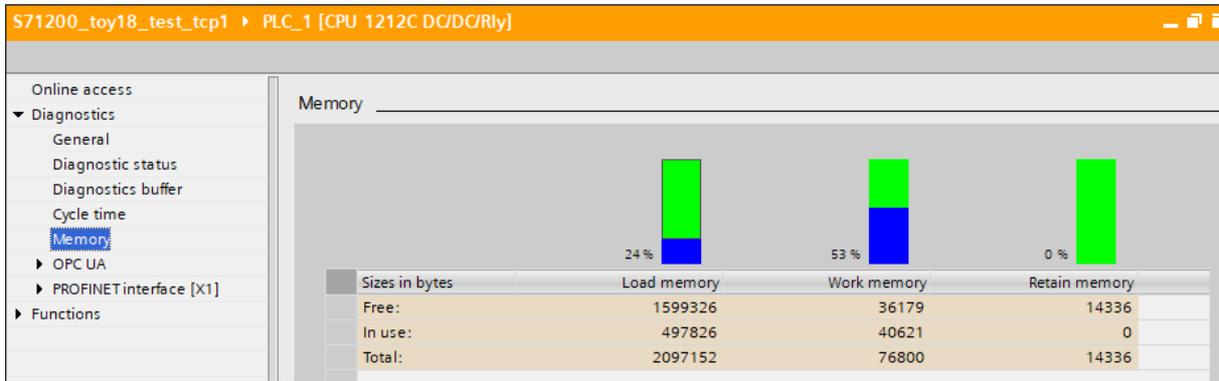

51	KeyLock	USInt	0	0
52	DisableRMT	Bool	false	FALSE
53	Absorbance	Array[0..3] of Real		
54	Absorbance[0]	Real	0.0	-4.84
55	Absorbance[1]	Real	0.0	-4.84
56	Absorbance[2]	Real	0.0	-4.84
57	Absorbance[3]	Real	0.0	-4.84
58	Abs_err	Array[0..3] of USInt		

Setting new wavelengths parameters can be done the same way (setting T18_DB.WPars.Wavelength and toggling T18_DB.bSendWL from FALSE to TRUE). Toggling T18_DB.bSendAutozero from FALSE to TRUE should make autozero and by parameter T18_DB.bSendClrErrors can be cleared errors and error sound.

It is possible to process detector commands manually when block TOY18_Control is disabled by T18_DB.bStart = FALSE. Then command needs to be set to T18_DB.ProtCtrl.nCmd (e.g. SAr = 16#534172) and toggling T18_DB.ProtCtrl.bCmd from FALSE to TRUE will do the job. Check T18_DB.RPars.Scan.

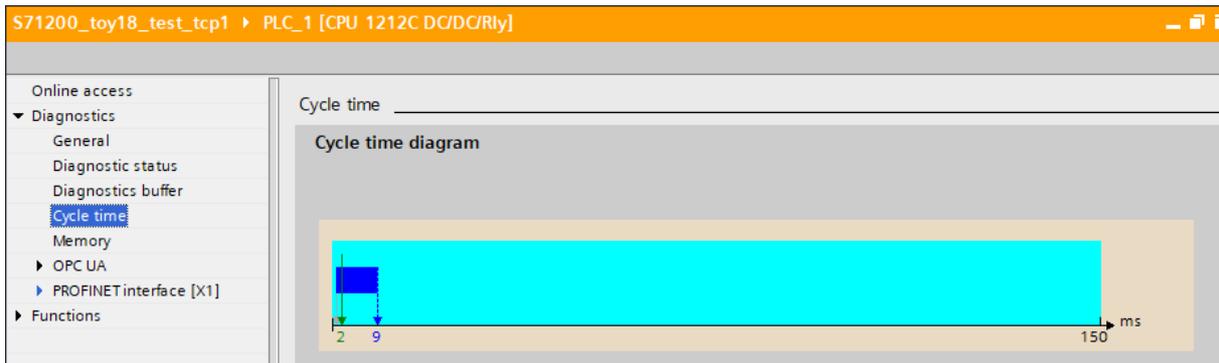

3	Errors	ERR_PARS		
4	bConnect	Bool	false	TRUE
5	bConnected	Bool	false	TRUE
6	COMCtrl	*COM_CTRL*		
7	PROTCtrl	*PROT_CTRL*		
8	bCmd	Bool	false	TRUE
9	nCmd	DWord	16#0	16#0053_4172
10	nTimeout	UDInt	1000	1000
11	bCmdDone	Bool	false	FALSE
12	bCmdBusy	Bool	false	FALSE
13	nCmdResult	UInt	0	0
14	bAsync	Bool	false	FALSE
15	nAsyncCmd	DWord	16#0	16#0041_5873
16	sendData	Array[0..127] of Byte		
17	recvData	Array[0..8191] of B...		
18	WPars	*TOY18_WPARS*		
19	RPars	*TOY18_RPARS*		
20	bStart	Bool	true	FALSE
21	bSendLamp	Bool	false	FALSE
22	bSendWL	Bool	false	FALSE
23	bSendAutozero	Bool	false	FALSE
24	bSendClrErrors	Bool	false	FALSE
25	bReady	Bool	false	FALSE
26	TextStatus	String	"	'Measure'

This project consumes aprox. 500 kB of Code memory (25 %) and aprox. 40 kB (53 %) of RAM memory for PLC S7-1200 1212C.

Note: RAM can be reduced by e.g. reducing of recvData buffer when commands CMD_READ_REPORT (upto 7kB), CMD_READ_SABS (upto 4kB) and CMD_READ_SINT (upto 3kB) are not used or by reducing of scan array in TOY18_SCAN when scanning commands (CMD_READ_SABS, CMD_READ_SINT) are not used.

Average PLC cycle time is 2-3 ms. The longest cycle time during general measurement (reading status and absorbance subscriptions) could take up to 10 ms.

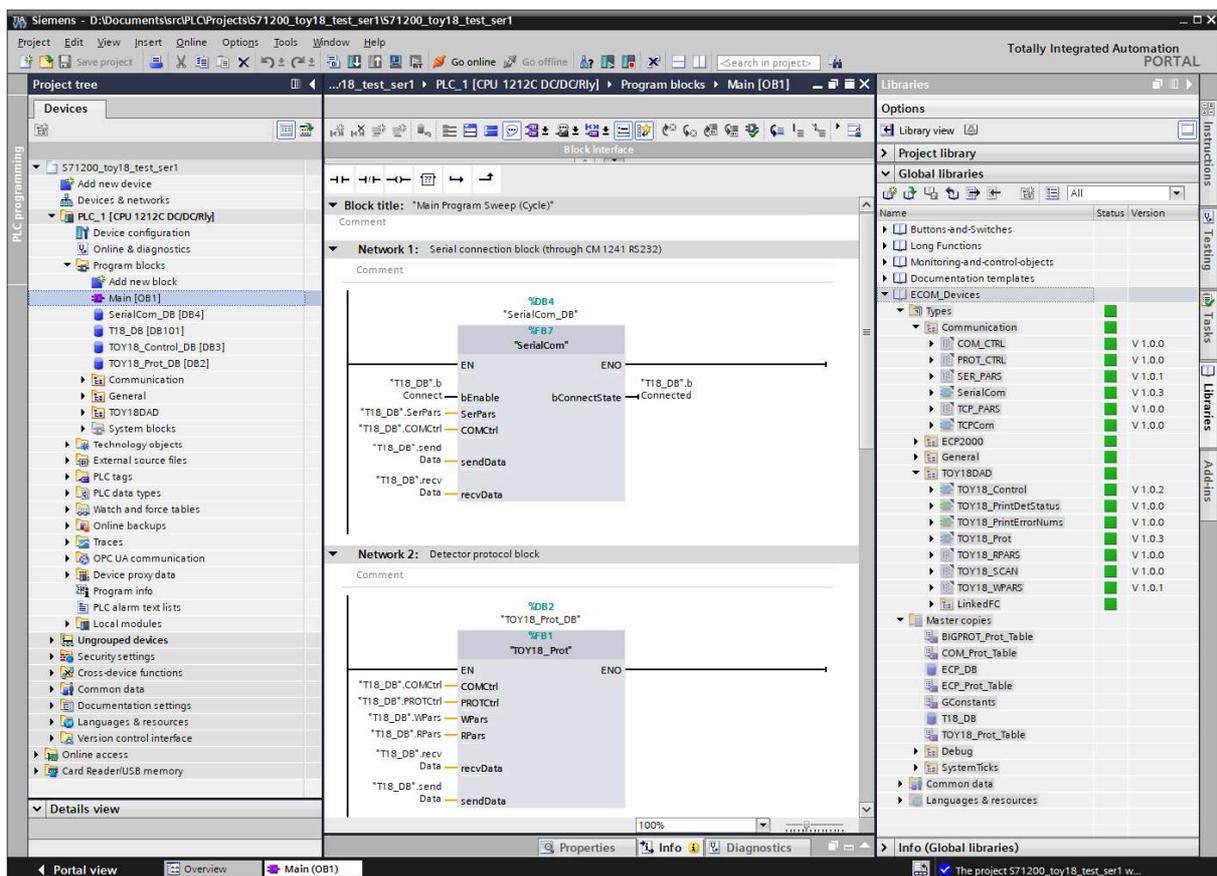

Note: Some commands (responses) can cause much longer cycle times. For example, response on command CMD_READ_SABS can prolong max. cycle time to aprox. 30 ms and response on command CMD_READ_REPORT up to aprox. 40 ms.

Project example 2 (S71200_toy18_test_ser1.ap17)

This project is almost the same as previous S71200_toy18_test_tcp1.ap17 with one difference. The block TCPCom was replaced by block SerialCom in Network 1 to realize serial communication with the TOY18DAD detector through CM 1241 module. This block needs T18_DB.SerPars parameters for selection and configuration of serial port. Such data type SER_PARS is defined in ECOM_Devices library.

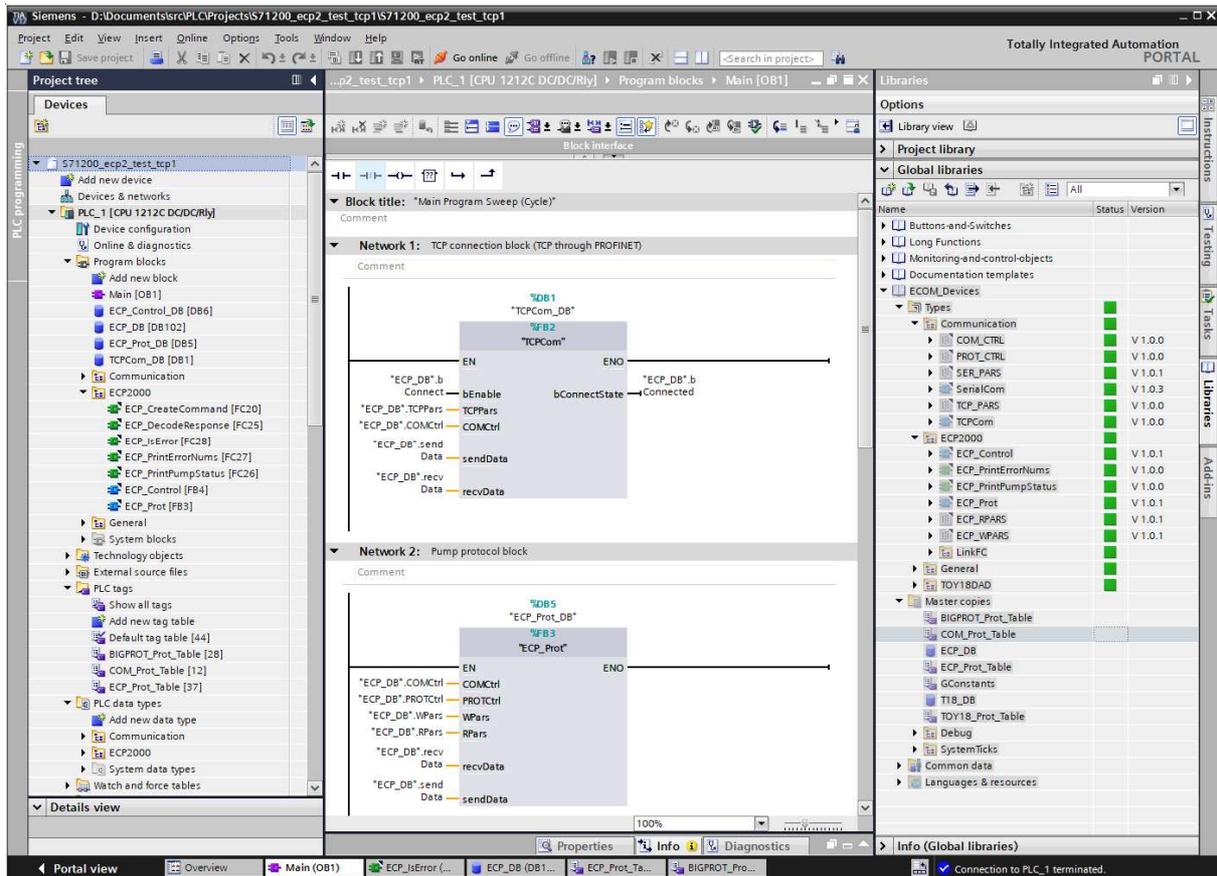

Warning: *Serial communication through module CM 1241 doesn't work so well as TCP communication in Siemens PLC. Actually, I realized various bugs, strange behavior or slow performance when using Ptp Communication functions (Port_Config, Send_Config, Receive_Config, Receive_Reset, Send_P2P and Receive_P2P). Example project does work, but some operations can fail (changing serial settings (baudrate) fails first time; response on command CMD_READ_REPORT would be uncomplete – data loss). It is recommended to use TCP communication (ERVIN7 module) if possible.*

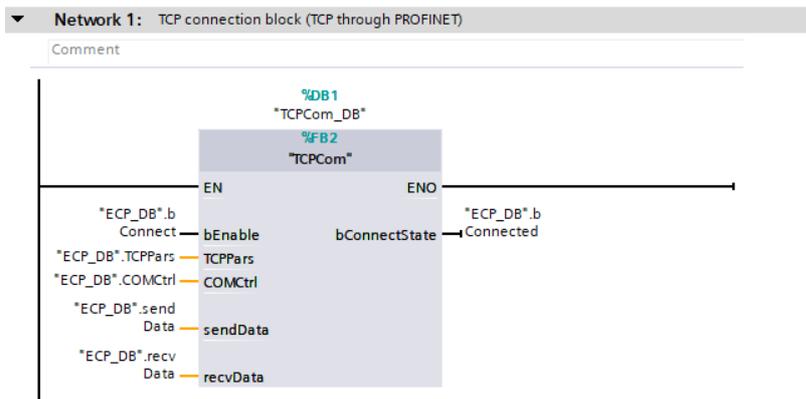

Project example 3 (S71200_ecp_test_tcp1.ap17)

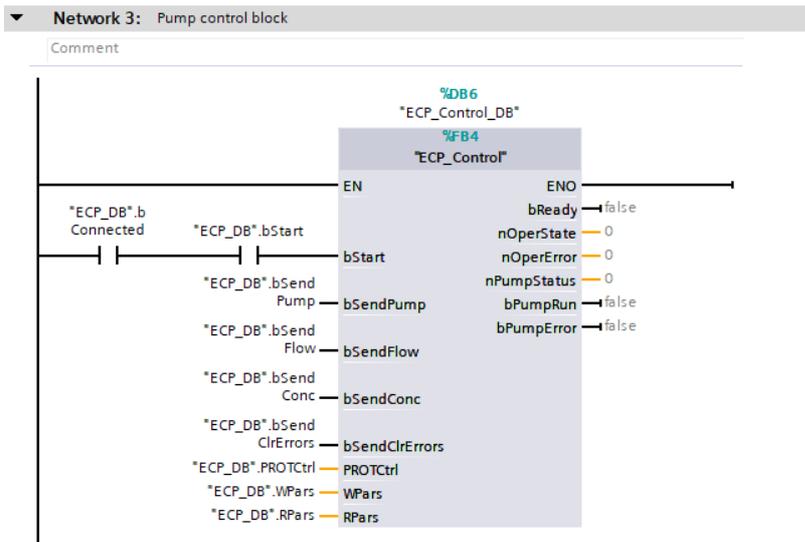

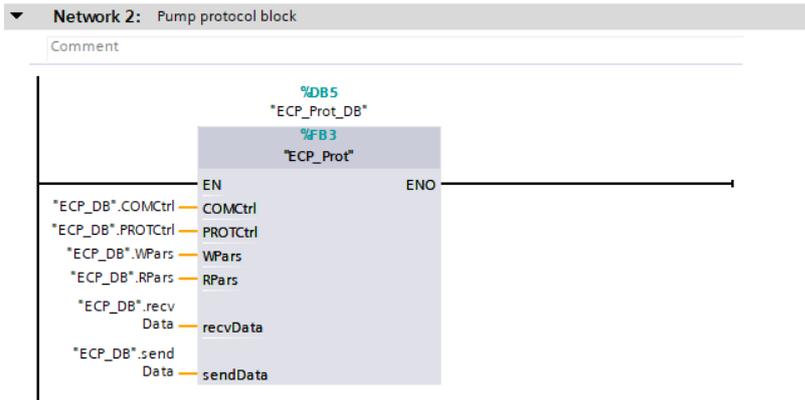

This project demonstrates communication with pump ECP2000 and concept is the same as previous project S71200_toy18_test_tcp1.ap17. Create new project and configure PLC. Add function blocks "TCPCom", "ECP_Prot" and "ECP_Control", tag tables "COM_Prot_Table", "ECP_Prot_Table", "BIGPROT_Prot_Table" and data block "ECP_DB" into project from ECOM_DEVICES library. Insert main function block into networks and define its parameters to match ECP_DB.

Project tree

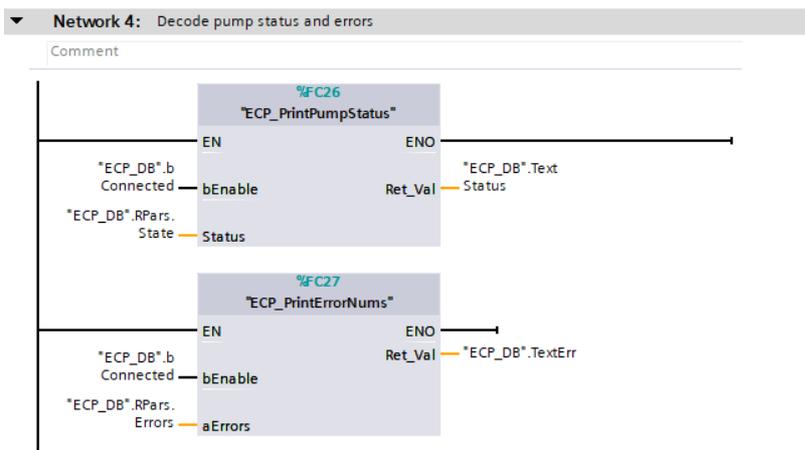

Main [OB1]

Network 4 demonstrates additional functions for decoding pump status and errors to strings.

ECP_DB [DB102]

Example of interconnection data block ECP_DB. Set default parameters to set adequate demands.

Project functionality

Parameter ECP_DB.TCPPars.RemoteAddress needs to be set correctly to match real pump. Connection is started by toggling parameter ECP_DB.bConnect from FALSE to TRUE. Successful connection is signaled by TRUE parameter ECP_DB.bConnected.

It is recommended to set all parameters available in ECP_DB.WPars to demanded default values. Communication can be started by settings parameter ECP_DB.bStart from FALSE to TRUE (default state after connection). If communication is successful the most of ECP_DB.WPars parameters would be written and the most of parameters in ECP_DB.RPars would be read and status variables would continue to be updated. If communication isn't running, check last protocol command ECP_DB.PROTCtrl.nCmd and its result ECP_DB.PROTCtrl.nCmdResult.

Simple pump control can be realized through ECP_Control block inputs. Pump would run by changing parameter ECP_DB.bSendPump from FALSE to TRUE and it would stop by changing the same parameter from TRUE to FALSE (this behavior influences parameter ECP_DB.WPars.DoCmd automatically). Setting flow can be done by modification parameter ECP_DB.WPars.SetFlow and changing ECP_DB.bSendFlow from FALSE to TRUE. Similar way can be used for concentration on gradient pump (set ECP_DB.WPars.Concentration array to be 100% in sum and change ECP_DB.bSendConc from FALSE to TRUE). Change of parameter ECP_DB.bSendClrErrors from FALSE to TRUE will send stop error sound command. Pump state, errors, warnings, pressure and other parameters are read continually in aprox. period 200 ms. Pressure variable is located at ECP_DB.RPars.ActualPressure.

RPars		ECP_RPARS			
12	bStart	Bool	true	TRUE	TRUE
13	bSendPump	Bool	false	TRUE	TRUE
14	bSendFlow	Bool	false	FALSE	FALSE

33	ActualPressure	Real	0.0	0.0	0.0

Function block ECP_Control can be modified for customer's needs. It operates sending of commands through ECP_Prot block. All used blocks and tables are described later in more detail.

Overview of main function blocks

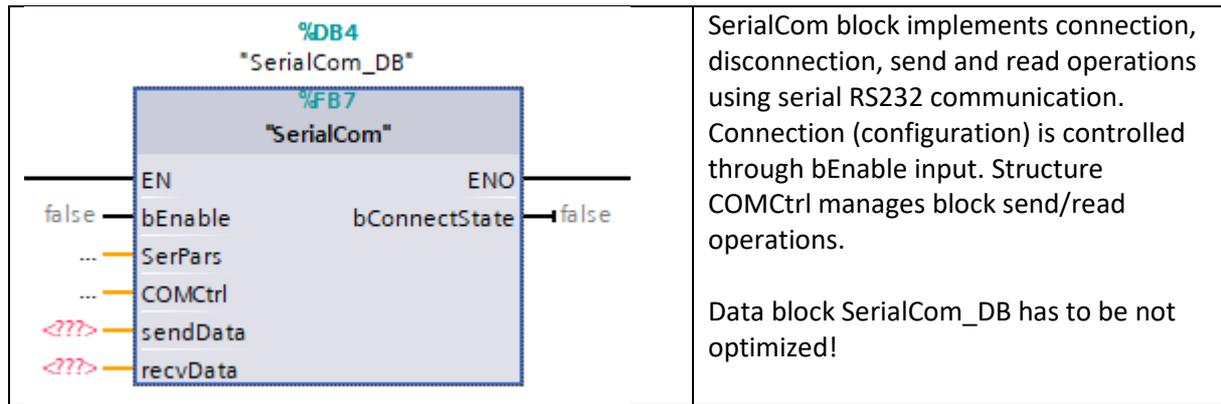

TCPCom

TCPCom block implements connection, disconnection, send and read operations using TCP communication. Connection/disconnection is controlled through bEnable input. Connection is realized according to TCPPars parameters and block tries to connect or hold connection even connection failed at once. Structure COMCtrl manages block send/read operations.

Parameter	Direction	Data type	Default	Description
bEnable	IN	Bool	False	Stores TCP parameters and starts connection upon a positive edge. Block tries to connect periodically when connection fails (partner not available). Starts disconnection upon a negative edge.
TCPPars	IN	TCP_PARS	---	Connection TCP parameters as ID, remote IP address and remote port.
COMCtrl	INOUT	COM_CTRL	---	Structure for control of sending (bSend, nWLen, bSent) and reading data (nRSize, nRIdx, bNdr, nRLen) from other control block. Block state and error (wState, wResult) can be read.
sendData	INOUT	Variant	---	Expects array of bytes for data to be sent. Size should be enough for the longest command.
recvData	INOUT	Variant	---	Expect array of bytes for read data. Size (nRSize) should be enough for the longest response.
bConnectState	OUT	Bool	False	Signaling connection state.

SerialCom

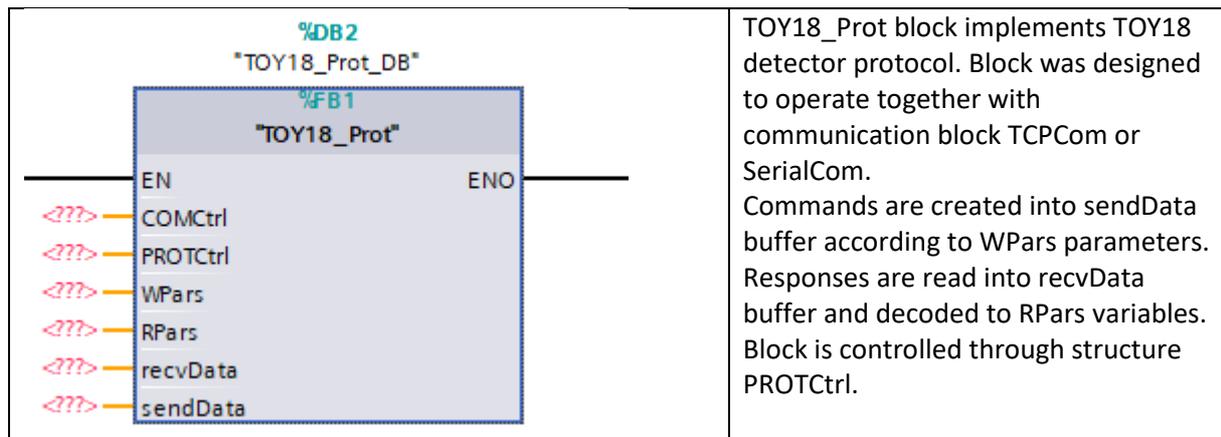

SerialCom block implements connection, disconnection, send and read operations using serial RS232 communication. Connection (configuration) is controlled through bEnable input. Structure COMCtrl manages block send/read operations.

Data block SerialCom_DB has to be not optimized!

Parameter	Direction	Data type	Default	Description
bEnable	IN	Bool	False	Stores serial parameters and starts connection (configuration) upon a positive edge. Starts disconnection (nothing) upon a negative edge.
SerPars	IN	SER_PARS	---	Connection serial parameters as port, baudrate selection, parity selection, databits selection and stopbits selection.
COMCtrl	INOUT	COM_CTRL	---	Structure for control of sending (bSend, nWLen, bSent) and reading data (nRSize, nRIdx, bNdr, nRLen) from other control block. Block state and error (wState, wResult) can be read.
sendData	INOUT	Variant	---	Expects array of bytes for data to be sent. Size should be enough for the longest command.
rcvData	INOUT	Variant	---	Expect array of bytes for read data. Size (nRSize) should be enough for the longest response.
bConnectState	OUT	Bool	False	Signaling connection state.

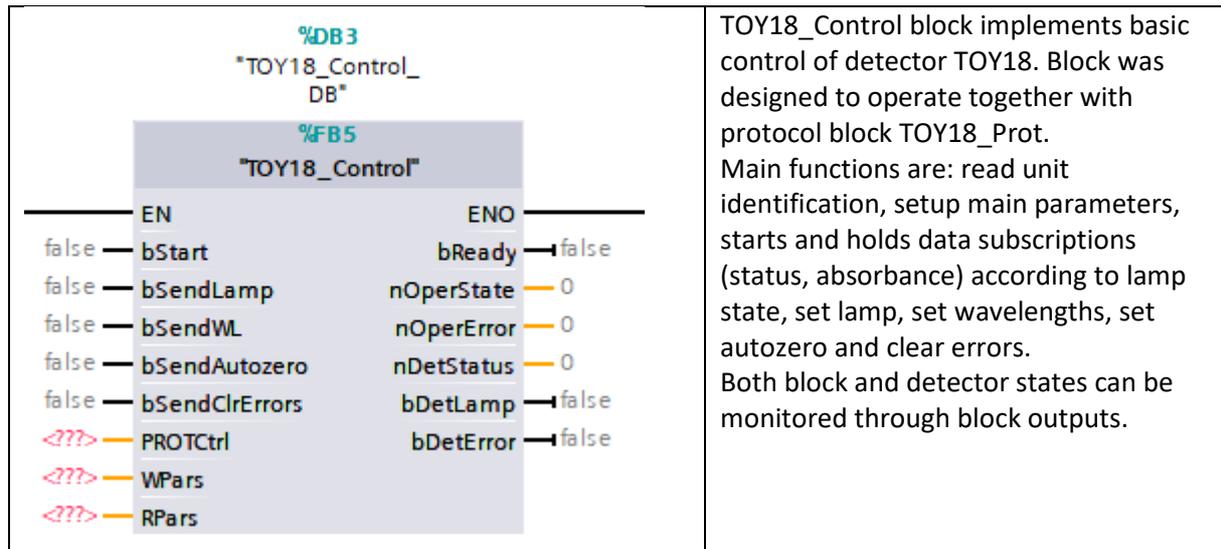

TOY18_Prot

TOY18_Prot block implements TOY18 detector protocol. Block was designed to operate together with communication block TCPCom or SerialCom. Commands are created into sendData buffer according to WPars parameters. Responses are read into recvData buffer and decoded to RPars variables. Block is controlled through structure PROTCtrl.

Parameter	Direction	Data type	Default	Description
COMCtrl	INOUT	COM_CTRL	---	Structure for controlling communication block TCPCom or SerialCom.
PROTCtrl	INOUT		---	Structure for controlling of this block. Parameter nCmd defines code for demanded command (see constants TOY18_Prot_Table), which is created and sent upon a positive edge of bCmd. Output bCmdBusy characterized command processing and outputs bCmdDone and nCmdResult show command result (ok, error). Parameters bAsync and nAsyncCmd can signal asynchronous data reception.
WPars	INOUT	TOY18_WPARS	---	Structure includes demanded setup parameters for detector TOY18 like wavelengths, rate, time constant, etc. These parameters are used during write commands mainly (e.g. CMD_WRITE_WL).
RPars	INOUT	TOY18_RPARS	---	Structure includes actual setup parameters and measured data for detector TOY18 like wavelengths, rate, time constant, absorbances, intensities, lamp time, etc. These parameters are used during both write and read commands often (e.g. CMD_WRITE_WL, CMD_READ_WL).
sendData	INOUT	Array[*] of Byte	---	Expects array of bytes for data to be sent. Size should be enough for the longest command.
recvData	INOUT	Array[*] of Byte	---	Expect array of bytes for read data. Size should be enough for the longest response.

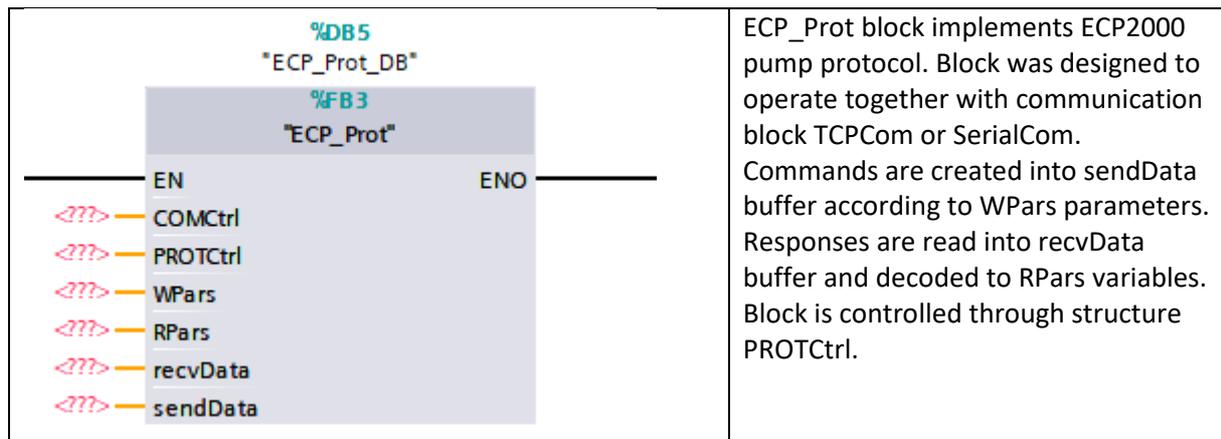

TOY18_Control

TOY18_Control block implements basic control of detector TOY18. Block was designed to operate together with protocol block TOY18_Prot. Main functions are: read unit identification, setup main parameters, starts and holds data subscriptions (status, absorbance) according to lamp state, set lamp, set wavelengths, set autozero and clear errors. Both block and detector states can be monitored through block outputs.

Parameter	Direction	Data type	Default	Description
bStart	IN	Bool	False	Starts unit setup (read identification, model, wl. range, write wavelengths, rate, tc, bandwidth, ...) upon a positive edge. Then it holds subscriptions to read status and measured data. Stops all subscriptions upon a negative edge.
bSendLamp	IN	Bool	False	Starts lamp write command. See parameter WParms.Lamp.
bSendWL	IN	Bool	False	Starts wavelength write command. See array parameter WParms.Wavelength.
bSendAutozero	IN	Bool	False	Starts autozero write command.
bSendClrErrors	IN	Bool	False	Starts clear errors write command.
PROTctrl	INOUT	COM_CTRL	---	Structure for controlling protocol block TOY18_Prot.
WParms	INOUT	TOY18_WPARS	---	Structure for write parameters.
RParms	INOUT	TOY18_RPARS	---	Structure for read parameters.
bReady	OUT	Bool	False	Signaling block ready state for sending commands (bSendLamp, ...).
nOperState	OUT	UInt	0	Signaling block internal operation state (0 – idle, 1 – init, 2 – read id, 3 – set parameters, 4 – ready, 5 – error, 6 – deinit).
nOperError	OUT	UInt	0	Signaling block internal error when nOperState=5 (ERR_CMD_x).
nDetStatus	OUT	UInt	0	Detector status. See TOY18_Prot_Table (DETSTATE_x). The same as RParms.State.
bDetLamp	OUT	Bool	False	Signaling detector active lamp state. See RParms.D2LampState.
bDetError	OUT	Bool	False	Signaling any detector error. See RParms.Errors for details.

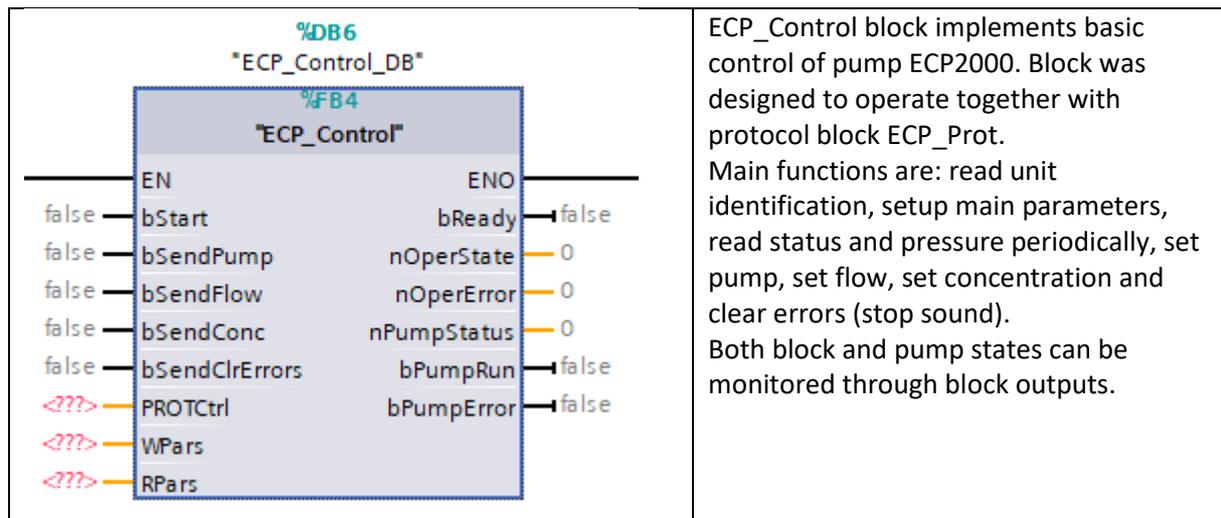

ECP_Prot

ECP_Prot block implements ECP2000 pump protocol. Block was designed to operate together with communication block TCPCom or SerialCom. Commands are created into sendData buffer according to WParms parameters. Responses are read into recvData buffer and decoded to RParms variables. Block is controlled through structure PROTCtrl.

Parameter	Direction	Data type	Default	Description
COMCtrl	INOUT	COM_CTRL	---	Structure for controlling communication block TCPCom or SerialCom.
PROTCtrl	INOUT		---	Structure for controlling of this block. Parameter nCmd defines code for demanded command (see constants BIGPROT_Prot_Table, ECP_Prot_Table), which is created and sent upon a positive edge of bCmd. Output bCmdBusy characterized command processing and outputs bCmdDone and nCmdResult show command result (ok, error). Parameters bAsync and nAsyncCmd can signal asynchronous data reception.
WParms	INOUT	ECP_WPARS	---	Structure includes demanded setup parameters for pump ECP2000 like flowrate, concentration and other configuration. These parameters are used during write commands mainly (e.g. ECP_CMD_SET_DFLOW).
RParms	INOUT	ECP_RPARS	---	Structure includes actual setup parameters and measured data for pump ECP2000 like set flow, actual flow, actual pressure, status, errors, etc. These parameters are used during read commands mainly (e.g. ECP_CMD_GET_DFLOW).
sendData	INOUT	Array[*] of Byte	---	Expects array of bytes for data to be sent. Size should be enough for the longest command.
recvData	INOUT	Array[*] of Byte	---	Expect array of bytes for read data. Size should be enough for the longest response.

ECP_Control

ECP_Control block implements basic control of pump ECP2000. Block was designed to operate together with protocol block ECP_Prot. Main functions are: read unit identification, setup main parameters, read status and pressure periodically, set pump, set flow, set concentration and clear errors (stop sound). Both block and pump states can be monitored through block outputs.

Parameter	Direction	Data type	Default	Description
bStart	IN	Bool	False	Starts unit setup (read identification, model, description, write flow, concentration, pres. limits, ...) upon a positive edge. Then it holds periodic reading of status and pressure data. Stops flow and all communication on a negative edge.
bSendPump	IN	Bool	False	Starts pump on positive edge and stops it on negative edge. Operation modify parameter WParms.DoCmd automatically.
bSendFlow	IN	Bool	False	Starts flow write command. See parameter WParms.SetFlow.
bSendConc	IN	Bool	False	Starts concentration write command. See array parameter WParms.Concentration.
bSendClrErrors	IN	Bool	False	Starts stop error sound write command.
PROTctrl	INOUT	COM_CTRL	---	Structure for controlling protocol block ECP_Prot.
WParms	INOUT	ECP_WPARS	---	Structure for write parameters.
RParms	INOUT	ECP_RPARS	---	Structure for read parameters.
bReady	OUT	Bool	False	Signaling block ready state for sending commands (bSendFlow, ...).
nOperState	OUT	UInt	0	Signaling block internal operation states (see TOY18_Control).
nOperError	OUT	UInt	0	Signaling block internal error when nOperState=5 (BP_CMDERR_x).
nPumpStatus	OUT	UInt	0	Pump status. See ECP_Prot_Table (ECP_STATUS_x). The same as RParms.State.
bPumpRun	OUT	Bool	False	Signaling pump active pumping state.
bPumpError	OUT	Bool	False	Signaling any pump error. See RParms.Errors for details.

Overview of types

TCP_PARS

<i>Name</i>	<i>Data type</i>	<i>Default</i>	<i>Description</i>
ID	CONN_OUC	1	
RemoteAddress	IP_V4	192.168.91.24	Array[1..4] of Byte
RemotePort	UInt	10001	

SER_PARS

<i>Name</i>	<i>Data type</i>	<i>Default</i>	<i>Description</i>
Port	UInt	0	
BaudIdx	UInt	11	11=115200 bd
ParityIdx	UInt	1	1=None
DatabitsIdx	UInt	1	1=8
StopbitsIdx	UInt	1	1=1

COM_CTRL

<i>Name</i>	<i>Data type</i>	<i>Default</i>	<i>Description</i>

CMD_READ_XTEST	DWord	16#585872	unsupported (testing ERR1)
CMD_READ_YTEST	DWord	16#585972	unsupported (testing timeout)
ERRCMD_NONE	UInt	0	no error
ERRCMD_UNKNOWN	UInt	1	unknown command, invalid pattern
ERRCMD_VALUE	UInt	2	invalid value range
ERRCMD_BUSY	UInt	3	unit busy
ERRCMD_MODE	UInt	4	invalid mode
ERRCMD_FAILED	UInt	5	operation failed
ERRCMD_BLOCKED	UInt	6	operation blocked
ERRCMD_LENGTH	UInt	10	invalid length or format (reception)
ERRCMD_CRC	UInt	11	invalid checksum (reception)
ERRCMD_IGNORE	UInt	12	command should be ignored (creation)
ERRCMD_TIMEOUT	UInt	13	no response in time (reception)
SCANTYPE_ABS	UInt	0	Scan ABS
SCANTYPE_INT	UInt	1	Scan INT
SCANTYPE_OTHER	UInt	2	Scan other (CCD)

Note: Constant values for commands are created from 3 first command/response letters (e.g. DTr = 16#445472). See www.asciitable.com for details.

List of COM constants (COM_Prot_Table)

Name	Data Type	Value	Comment
BAUDIDX_9600	UInt	6	Index for baudrate 9600bd
BAUDIDX_19200	UInt	7	Index for baudrate 19200bd
BAUDIDX_38400	UInt	8	Index for baudrate 38400bd
BAUDIDX_57600	UInt	9	Index for baudrate 57600bd
BAUDIDX_115200	UInt	11	Index for baudrate 115200bd
PARITYIDX_NONE	UInt	1	Index for no parity
PARITYIDX_EVEN	UInt	2	Index for even parity
PARITYIDX_ODD	UInt	3	Index for odd parity
DATABITSIDX_8	UInt	1	Index for 8 databits
DATABITSIDX_7	UInt	2	Index for 7 databits
STOPBITSIDX_1	UInt	1	Index for 1 stopbit
STOPBITSIDX_2	UInt	2	Index for 2 stopbits

List of BIGProtocol constants (BIGPROT_Prot_Table)

Name	Data Type	Value	Comment
BP_CMD_GET_INFO	Word	16#0000	
BP_CMD_GET_USPEC	Word	16#0006	
BP_CMD_GET_BRDCOUNT	Word	16#0010	
BP_CMD_GET_BRDINFO	Word	16#0012	
BP_CMD_GET_ETHCFG	Word	16#0020	
BP_CMD_SET_ETHCFG	Word	16#0021	
BP_CMD_GET_ETHINFO	Word	16#0022	
BP_CMD_GET_LOGCOUNT	Word	16#0032	
BP_CMD_GET_LOGDATA	Word	16#0034	
BP_CMD_GET_CMPCOUNT	Word	16#0036	
BP_CMD_GET_CMPDATA	Word	16#0038	
BP_CMD_GET_REPORTCOUNT	Word	16#0040	
BP_CMD_GET_REPORTDATA	Word	16#0042	
BP_CMD_MAKE_BEEP	Word	16#0051	
BP_CMD_STOP_SOUND	Word	16#0053	
BP_CMDERR_NONE	UInt	0	no error
BP_CMDERR_UNKNOWN	UInt	1	unknown command, invalid pattern
BP_CMDERR_BUSY	UInt	2	unit busy
BP_CMDERR_SIZE	UInt	3	invalid length or format (reception)
BP_CMDERR_VALUE	UInt	4	invalid value range
BP_CMDERR_MODE	UInt	5	invalid mode
BP_CMDERR_PENDING	UInt	6	pending
BP_CMDERR_FAILED	UInt	7	operation failed
BP_CMDERR_BLOCKED	UInt	8	operation blocked
BP_CMDERR_UNCOMPLETE	UInt	10	uncomplete command (reception)
BP_CMDERR_CRC	UInt	11	invalid crc (reception)
BP_CMDERR_IGNORE	UInt	12	command should be ignored (creation)
BP_CMDERR_TIMEOUT	UInt	13	no response in time (reception)

List of ECP2000 constants (ECP_Prot_Table)

Name	Data Type	Value	Comment
ECP_CMD_GET_STATUS	Word	16#0120	
ECP_CMD_DO_COMMAND	Word	16#0123	
ECP_CMD_GET_DESC	Word	16#0124	
ECP_CMD_GET_GRADCFG	Word	16#0162	
ECP_CMD_SET_GRADCFG	Word	16#0163	
ECP_CMD_GET_CFGA	Word	16#0166	Unsupported
ECP_CMD_SET_CFGA	Word	16#0167	Unsupported
ECP_CMD_GET_PUMPCFG2	Word	16#0168	
ECP_CMD_SET_PUMPCFG2	Word	16#0169	
ECP_CMD_GET_IFCCFG	Word	16#0170	Unsupported
ECP_CMD_SET_IFCCFG	Word	16#0171	Unsupported
ECP_CMD_GET_VALVEMAP	Word	16#0172	
ECP_CMD_SET_VALVEMAP	Word	16#0173	
ECP_CMD_GET_DFLOW	Word	16#0180	Read desired flow
ECP_CMD_SET_DFLOW	Word	16#0181	Write desired flow
ECP_CMD_GET_DPRESS	Word	16#0182	Read desired pressure
ECP_CMD_SET_DPRESS	Word	16#0183	Write desired pressure
ECP_CMD_GET_PRESSLIMITS	Word	16#0184	
ECP_CMD_SET_PRESSLIMITS	Word	16#0185	
ECP_CMD_GET_VALVE	Word	16#0186	
ECP_CMD_SET_VALVE	Word	16#0187	
ECP_CMD_GET_CONC	Word	16#0188	
ECP_CMD_SET_CONC	Word	16#0189	
ECP_CMD_GET_PRES	Word	16#01A0	
ECP_STATUS_INIT	USInt	0	
ECP_STATUS_PREP	USInt	1	
ECP_STATUS_STOPPED	USInt	2	
ECP_STATUS_RUN	USInt	3	
ECP_DOCMD_NONE	USInt	0	
ECP_DOCMD_PUMP	USInt	1	
ECP_DOCMD_STOP	USInt	2	
ECP_DOCMD_PUMPSAFE	USInt	8	
ECP_DOCMD_PURGEMODEON	USInt	101	
ECP_DOCMD_PURGEMODEOFF	USInt	102	
ECP_DOCMD_CLOSEVALVES	USInt	111	
ECP_DOCMD_QUITPROG	USInt	112	
ECP_DOCMD_OPENVALIDVALVE	USInt	113	

List of functions in ECOM_DEVICES library

Name	Category	Comment
SerialCOM	Communication	FB for serial communication
TCPCom	Communication	FB for TCP communication
BIGPROT_CalcCrc	General	Calculate BP CRC for demanded data
BIGPROT_TestRHeader	General	Test complete received header (size, CRC, ...)
Cipher_TO_DecChar	General	Convert cipher to decadic value
DecChars_TO_DInt	General	Convert decadic character ('0' to '9') to value
GetArraySize	General	Return size of an array
HexChars_TO_Real	General	Convert hexadecimal characters to real value
HexChars_TO_UDInt	General	Convert hexadecimal characters to integer value
Nibble_TO_HexChar	General	Convert half-byte to hexadecimal character
TOY18_Control	TOY18DAD	FB for basic control of detector TOY18DAD
TOY18_PrintErrorNums	TOY18DAD	Convert detector error array to string (list of numbers)
TOY18_PrintDetStatus	TOY18DAD	Convert detector status code to string
TOY18_Prot	TOY18DAD	FB for detector TOY18DAD protocol
TOY18_CommandID	TOY18DAD-LinkedFC	Return value from command/response header
TOY18_CreateCommandStr	TOY18DAD-LinkedFC	Create command string for demanded command (WPars is needed)
TOY18_DecodeAbsorbance	TOY18DAD-LinkedFC	Decode absorbance response (RPar.Absorbance)
TOY18_DecodeBoolVal	TOY18DAD-LinkedFC	Decode logic response
TOY18_DecodeCmdError	TOY18DAD-LinkedFC	Decode error response (return error)
TOY18_DecodeDetModel	TOY18DAD-LinkedFC	Decode detector model from already read parameters (name, model)
TOY18_DecodeIntensity	TOY18DAD-LinkedFC	Decode intensity response (RPar.Intensity)
TOY18_DecodeResponse	TOY18DAD-LinkedFC	Decode any response
TOY18_DecodeScan	TOY18DAD-LinkedFC	Decode scan response (RPar.Scan)
TOY18_DecodeStatus	TOY18DAD-LinkedFC	Decode status response (states, errors, io, lamp times, intensity)
TOY18_DecodeStatusOld	TOY18DAD-LinkedFC	Decode old status response (state, old errors)
TOY18_DecodeWavelength	TOY18DAD-LinkedFC	Decode wavelength response (RPar.Wavelength)
TOY18_TestChannels	TOY18DAD-LinkedFC	Check response for channels
TOY18_TestCheckSum16	TOY18DAD-LinkedFC	Check response for 16bit checksum
TOY18_TestCheckSum24	TOY18DAD-LinkedFC	Check response for 24bit checksum
ECP_Control	ECP2000	FB for basic control of pump ECP2000
ECP_PrintErrorNums	ECP2000	Convert pump error array to string (list of numbers)
ECP_PrintPumpStatus	ECP2000	Convert pump status code to string
ECP_Prot	ECP2000	FB for pump ECP2000 protocol
ECP_CreateCommand	ECP2000-LinkedFC	Create command data for demanded pump command
ECP_DecodeResponse	ECP2000-LinkedFC	Decode any pump response
ECP_IsError	ECP2000-LinkedFC	Test for error in error array (RPar.Errors)
DBGLog	Debug	Store string into log (MyDebug_DB is needed)
DBGLogBuf	Debug	Store buffer into log (MyDebug_DB is needed)
MyDebug	Debug	FB for storing logs (buffer of strings)
GetSysTicks	SystemTicks	Return millisecond system time (SystemTicks_DB is needed)
SystemTicks	SystemTicks	FB for operation of system ticks
